3	Usage examples	7
4	API	9
4.1	jts_erd	9
	Python Module Index	11
	Index	13

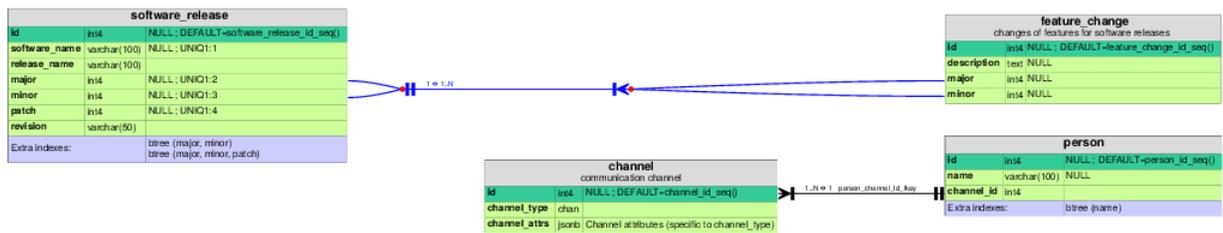

jts_erd creates an ERD (entity-relationship diagram).
It requires an extension of a json-table-schema as input.
Depends on pygraphviz.

INTRODUCTION

For now please look at these slides: [20150927_talk.pdf](#)

TL;DR Generate an entity-relationship diagram for a schema given as [JSON-table-schema](#).

Example of a resulting ERD:

INSTALLATION

Install graphviz and build tools:

```
aptitude install pkg-config build-essential graphviz libgraphviz-dev
```

You will need at least PyGraphviz 1.3.1 when using python3.

Currently (as of version 1.3.1 of pygraphviz) on at least debian and ubuntu you need special install options due to a bug (<https://github.com/pygraphviz/pygraphviz/issues/71>):

```
pip3 install pygraphviz --install-option="--include-path=/usr/include/graphviz" --  
↪install-option="--library-path=/usr/lib/graphviz/"
```

(gcc still throws a warning.)

Prepare a virtualenv with python3:

```
mkdir jts_erd  
cd jts_erd  
virtualenv -p python3  
source bin/activate
```

In the virtualenv root dir:

```
git clone https://github.com/iburadempa/jts_erd.git
```

USAGE EXAMPLES

The main function `jts_erd.get_graph()` creates a graphviz graph from a (JSON-decoded) JSON-table-schema. An accompanying function, `jts_erd.save_svg()`, renders a graph in SVG format and saves it.

For examples look at the examples directory, https://github.com/iburadempa/jts_erd/tree/master/examples

4.1 jts_erd

Generate an entity-relationship diagram from an extended JSON table schema.

JSON table schema is a simple schema for describing the structure of tabular data. It can be extended to allow for a comprehensive representation of an SQL relational database schema.

Starting from such a description this python module generates visualizations of the database schema using [graphviz](#) via [PyGraphviz](#).

```
jts_erd.jts_erd.get_graph(json_table_schema, **options)
```

Create and return a graph from the given *json_table_schema*.

All keys from *options_defaults* are allowed in *kwargs*.

```
jts_erd.jts_erd.options_defaults = {'bgcolor_indexes': '#ccccff',  
'default_namespace_name': 'public', 'display_columns': True, 'display_crowfoots':  
True, 'display_indexes': True, 'display_tooltips': True, 'edge_thickness': 1.0,  
'fontname': 'Helvetica', 'fontsize': 8, 'fontsize_label': 6, 'fontsize_title': 10,  
'html_color_default': '#ccff99', 'html_color_header': 'lightgrey',  
'html_color_header_for_table': {}, 'html_color_highlight': '#33cc99',  
'omit_isolated_tables': False, 'rankdir': 'LR', 'table_comment_wrap_width': 70}
```

Options and their default values.

Options:

- **html_color_header**
- **html_color_header_for_table**
- **html_color_default**
- **html_color_highlight**
- **fontname**
- **fontsize**
- **fontsize_title**
- **fontsize_label**
- **bgcolor_indexes**
- **rankdir**: 'LR' or 'RL'; whether dependent tables appear on the right (left) hand side
- **edge_thickness**
- **display_columns**: bool

- **display_indexes**: bool
- **display_crowfoots**: bool
- **display_tooltips**: bool
- **omit_isolated_tables**: bool
- **default_namespace_name**: string

`jts_erd.jts_erd.save_svg(json_database_schema, filepath, **options)`

Write an ERD in SVG format for a database to a file.

json_database_schema must be compatible with what `pg_jts` produces. *filepath* must end in `'.svg'`.
